

Server Launch Scripts

This folder contains scripts to easily launch the backend server and ngrok tunnel simultaneously.

How to Launch

macOS

Run the ``.command`` file:

```
./run_macos.command
```

Note: If this is your first time running the script, you must make it executable. Open your terminal and run:

```
cd "/path/to/your/project/server_run_script"  
chmod +x run_macos.command
```

Windows

Double-click or run the ``.bat`` file:

```
run_windows.bat
```

What Happens

1. The scripts execute ``launcher.js``.
2. ``launcher.js`` starts the Node.js backend server and the ``ngrok`` tunnel.
3. The script will poll the ngrok API and print the **Ngrok Public URL** to the console once it becomes available.

How to Stop

To stop both the server and the ngrok tunnel:

- Press ``Ctrl + C`` in the terminal window.
- Or simply close the terminal window.
